SUMMARY

The appraisal of the therapeutic effectiveness of the complex biological preparation **Traumeel S** in the treatment of patients suffering from chronic urethro-prostatitis was conducted. 50 patients were included into the program. All patients were distributed into two groups - the main group (n=30) and the control group (n=20).

Patients of the main group received, in addition to conventional anti-inflammatory treatment, a variety of dosage forms of Traumeel:

Tablets	one 3x/day
Injection solution	2.2 ml 2x/week, i.m.
Ointment	every other day, massaged on prostate

Keywords: Traumeel S,
Urethro-prostatitis

The control group patients received only conventional anti-inflammatory therapy. Before and after the treatment analyses were performed to investigate the pathological microbiological flora.

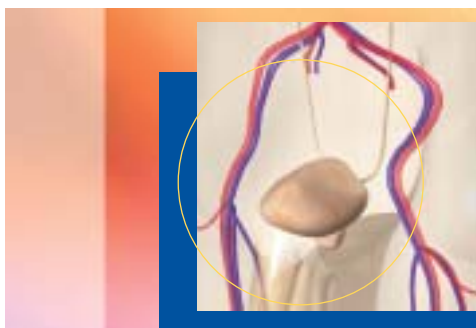

In the conducted investigation the complex biological preparation **Traumeel S** proved itself to be an effective anti-inflammatory preparation in treatment of the reactive phase affecting the urethra and prostate gland. It promoted a pronounced decrease of pain and of leukocyte infiltration to the urethral mucosa and to prostatic tissue.

Traumeel S combines well with other treatment modalities such as physiotherapy, prostate massage, antibiotic therapy.

The good tolerance and absence of pronounced adverse effects permits the recommendation of the complex biological preparation **Traumeel S** for the treatment of men suffering from chronic urethro-prostatitis.
